LATE SUMMER RISE IN HIRED FARM WORKERS GREATER THAN USUAL

The number of hired workers employed on farms showed a larger than usual seasonal increase during August, and on September 1 was about the same as a year earlier, the United States Department of Agriculture reported today. During the past year the monthly estimates of the number of hired workers have averaged about 100,000 less than for the same months a year earlier. Hired workers totaled 2,813,000 this month, just a little less than on September 1, 1944.

Some workers released from war industries and the armed forces are already returning to work on farms. On the whole, however, few residents and former residents of rural areas discharged from war jobs are now returning to farm employment. Shifts from industries to farms probably will not result in any immediate sharp upturn in farm employment. The return of former workers to the farm will result in much replacement of young boys and old men, hired of necessity, and of women and children of farm operator's families, by able-bodied and more efficient workers.

Operators were still working more hours per day on September 1 than before the war, but less than a year ago. Average number of hours worked per day by farm operators declined from 12.1 to 11.9. In 1939, the average was 11.7 hours. The workday for hired labor averaged 9.9 hours, compared with 10.0 hours a year ago, and 10.1 hours, on September 1, 1939.

Total employment on farms, at 10,907,000 workers on September 1, was up 3 percent from a month earlier. Seasonal labor requirements for picking cotton in the South, and for the harvest of grains, fruit and specialty crops in the West, were primarily responsible for the increase. In other areas fewer people were working on farms than on August 1. Total farm employment was, however, 1 percent less this month than the 11,040,000 of a year ago. The decrease was greatest in the West South Central States, where rain and wet fields delayed cotton picking in Texas. The East South Central, the West North Central and the Middle Atlantic regions also showed decreases. The Pacific region showed an increase of 3 percent.

The number of family workers employed on farms September 1 was slightly greater than a month earlier. Increases in the number working in the cotton area of the South and on the Pacific Coast were responsible for the change during August from 7,970,000 to 8,094,000. All other areas had fewer family laborers at work, since the summer harvest season was nearly over and the heavy fall

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics
Crop Reporting Board

load of work was not yet at hand. The family worker estimate of September 1 was 127,000 less than at the same time a year earlier. Almost all areas showed some decline with slight increases in only the New England, East North Central and South Atlantic regions.

Farm employment in the New England States at 275,000 persons on September 1, was seasonally lower than the 301,000 persons employed a month earlier. Summer work in the harvest of small grains and hay was about complete. As a result, the number of hired workers declined to 102,000 from 125,000 on August 1. The harvest of early fields of potatoes in Arcostock county, Maine, and of the Massachusetts cranberry crop, was not yet far enough advanced to require large numbers of hired laborers. However, sufficient work was being done on dairy and other farms around September 1 to maintain employment of family workers at 173,000 not much below the 176,000 a month earlier.

The number of all workers employed on New England farms this year on September 1 was 4,000 larger than a year ago. This increase was equally divided between family workers and hired workers. Average hours worked per day were less than a year ago, farm operators worked 12.0 hours per day around the first of this month and 12.3 hours a year earlier. Hired workers averaged 9.6 hours per day this year and 9.3 hours last year.

This year's September 1 estimate of 702,000 persons employed on farms in the Middle Atlantic States exceeded by 1 percent the total of 694,000 farm workers for a year earlier. A 9 percent increase in the number of hired workers from 246,000 a year ago to 269,000 was more than enough to offset a 3 percent decrease in family employment. The number of family workers added up to 433,000 on September 1 of this year, compared to 449,000 a year earlier. The total number of persons working was less, and work days were a little shorter. Farm operators averaged 12.4 hours per day and hired workers 10.3 hours, compared with 12.7 hours for operators and 10.4 hours for hired hands a year ago.

Labor requirements in the Middle Atlantic States declined during August, as the wheat, oat and hay harvest neared completion. Employment dropped about 9 percent during August. The number of family workers was 5 percent less than the 457,000 working on the first of last month, while the number of hired workers decreased 12 percent. Less labor than usual was required for the truck crop section of central and southern New Jersey, because of short production of summer maturing crops. The usual family labor was able to handle most of the plowing for fall grains, which was started by September 1 in New York and Pennsylvania, as well as some tobacco cutting in Pennsylvania.

The usual lull between summer and fall harvest seasons in the East North Central States caused farm employment to decline during August. Threshing of small grains was mostly completed, with plowing for winter wheat one of the main tasks. Total farm employment, of 1,478,000 persons, was 3 percent less on September 1 than the 1,528,000 workers employed a month earlier. The number of family workers decreased from 1,220,000 to 1,197,000 persons, and hired workers from 308,000 to 281,000.

There were about the same number of persons working on farms on September 1 as a year earlier. The 6,000 increase in the number of family workers from the 1,191,000 of a year ago about offset the 5,000 decrease in the number of hired

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics
Crop Reporting Board

workers. Hours worked per day averaged 12.3 for farm operators, compared with 12.4 hours a year ago, while the average day for hired workers was 10.5 hours, compared with 10.7 last year.

The number of hired workers increased more than last year from August 1 to September 1 in the West North Central States. The increase amounted to 31,000 persons this year, compared with 11,000 for the same period a year ago. Hired workers totaled 358,000 on September 1, 1945 and 327,000 a month earlier. Employment of grain harvest hands in most of the northern part of the region accounted for most of the increase. Furthermore, potato digging had started by the first of September. Family employment dropped to 1,369,000 on September 1, from 1,414,000 a month earlier, as most grain harvest operations were completed by September 1 in the southern part of the region. Plowing and soil preparation for winter wheat were in progress, with a considerable acreage already planted in western Kansas. The increase from a month ago in hired workers was not sufficient to balance the decrease in family workers as total employment declined from 1,741,000 on August 1 to 1,727,000.

Total employment on September 1 continued to be below the corresponding month last year, as the number of family workers was about 1 percent less and hired workers 5 percent less. Farm operators averaged 12.7 hours work per day, the same as a year ago, and hired workers averaged 10.9 hours, an increase from the 10.8 hours of last year. Work days averaged longer in this region than in any other.

Cotton picking had moved to northern Georgia and South Carolina by September 1, and caused an increase from August 1 in both family and hired workers employed on farms in the South Atlantic States. Total employment was up about 9 percent, from 1,922,000 workers to 2,000,000 on September 1. The number of family workers increased from 1,518,000 to 1,588,000, and hired workers from 404,000 to 502,000. Peanuts were also being harvested in this region. Tobacco cutting was nearly finished in North Carolina, progressing rapidly in Virginia and just starting in West Virginia.

Employment on September 1 was about the same as a year earlier. Both the number of all and of family workers changed less than a half percent, while hired workers were about 2 percent fewer. With about the same working force, workdays were shorter than a year earlier. Operators averaged 0.3 hours less per day than the 11.8 hours of last year while the average day for hired workers was 9.4 hours, compared with 9.8 hours last year.

The greatest increase in farm employment during August was shown by the East South Central States. Family employment was up 15 percent, hired employment up 36 percent, and the combined total up 18 percent. Cotton picking in Alabama and Mississippi, tobacco cutting in Kentucky, and hay making in the entire area required a large part of the available labor. Employment on the first of the month totaled 1,657,000 workers, 1,407,000 family and 250,000 hired, compared with a total of 1,408,000 on August 1. Family workers made up 1,224,000 of the August 1 total, and hired workers the remainder of 134,000.

Although the seasonal increase was large, the number of farm workers was 32,000 less than the 2,099,000 of a year ago. The number of family workers was a little more than 2 percent, or 38,000 persons, less than the 1,445,000 last year.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics
Crop Reporting Board

The number of hired workers was greater, but the increase from the 244,000 hired workers of a year ago amounted to only 6,000 workers. Average hours worked per day were also less than a year earlier. Farm operators averaged 11.3 hours per day the first of this month and 11.4 hours a year ago, while the average work day of hired workers dropped 0.1 hour from a year ago to 9.7 hours.

Total farm employment in the West South Central States decreased 6 percent from August 1 to September 1. The decrease was somewhat greater than usual, as rain and wet fields caused some delay in cotton picking and other field work in east central Texas. Hay making was an important task in most of the area. Fall plowing was getting underway in Arkansas, Oklahoma and Texas, with a considerable acreage of wheat planted in some counties in the High Plains area of Texas. These and other jobs employed 1,268,000 family workers and 351,000 hired workers. Total employment on September 1 was 1,619,000, compared with 1,723,000 on August 1. The number of family workers was almost 5 percent less than on the first of August, and the number of hired workers was 11 percent less.

Farm employment on September 1 was about 5 percent less than the 1,710,000 a year ago. Both the number of family workers and of hired workers showed decreases: family workers 3 percent and hired workers 12 percent. Family workers totaled 1,311,000 persons a year ago and hired workers 399,000. Hours worked per day averaged 11.5 for farm operators, the same as a year earlier, while hired workers averaged 9.6 hours, 0.3 hours per day less than last year.

There were 519,000 persons working on farms about the first of September in the Mountain States. This was 4 percent more than the 500,000 of August 1 and the same as on September 1 a year ago. The number of family workers, at 320,000, was almost the same as on August 1, but a little short of the 328,000 of September 1, 1944. However, the number of hired workers increased 12 percent, from 178,000 on August 1 to 199,000 on September 1. This was only 8,000 more than a year earlier. As in most other areas, average hours worked per day declined. Farm operators averaged 12.5 hours per day, compared with 12.7 hours on September 1, 1944. Workdays of hired labor, at 9.7 hours, were 0.2 hours less than last September 1.

Farm work around September 1 was characterized by its variety. In the northern part of the area, grain harvest was being completed, and ground preparation and seeding of fall grains were being carried on at the same time. Truck and vegetable crops were being harvested in Colorado and New Mexico; harvest of early potatoes continued in Idaho; bean harvest was started in the Big Horn Basin in Wyoming; flax was being cut generally in Montana; and the early peach harvest was started in Utah. In addition, cattle and sheep required the usual amount of labor.

Farm employment in the Pacific States was approaching its annual peak. Employment on September 1 was up sharply from August 1, almost 16 percent, and was 3 percent greater than a year earlier. There were 840,000 people working on farms or ranches around the first of this month, compared with 727,000 on August 1, and 815,000 on September 1, 1944. The number of family workers, at 339,000, was 9 percent larger than on August 1, but 4 percent less than a year earlier. High wage rates for farm work on the Pacific Coast, the highest paid in any section of the country, appeared to be attracting some workers released by industry. Hired workers numbered 501,000, an increase of 9 percent from a year earlier, and of 20 percent from August 1. The length of workday was slightly less than a year earlier. Farm operators averaged 11.4 hours per day, 0.3 hours less than a

year ago while the work day for hired labor averaged 9.3 hours the same as a year ago and the shortest in the nation.

Farm labor was employed at very diversified operations. In California alone, major jobs ranged from harvest of citrus in southern California; harvest of peaches, pears, almonds, prunes, grapes, tomatoes, other vegetables, melons and hay, to harvest of sugar beets, potatoes, and seed crops in specialized areas. Harvest of small grains was generally nearly complete in Oregon and Washington. Preparation for fall grain seeding was beginning, mostly with family labor. Hop picking in both Washington and Oregon drew heavily on the supply of hired labor.
